

BEV CHECK

Scope of Analysis:

The BevCheck is a 79 item test which includes: metals (lead, iron, copper, aluminum, arsenic, calcium, magnesium, etc.); inorganics & physical factors (hardness, TDS, pH, nitrates, fluoride, bromide, etc.); volatile organic chemicals (MTBE, toluene, xylenes, benzene, etc.); disinfection by-products (THM's and bromate by method 300.1).

Developed at Customer Request:

The BevCheck was developed based on the needs of our bottled water and beverage customers. We put together a test package that includes parameters most often requested by customers for the purpose of periodic quality control monitoring of process or finished product water. This test package also incorporates items essential to investigating the viability of a new water source to be used for bottled water production.

As a test for potential new bottled water sources, the BevCheck surpasses our previous offering in many ways, such as:

- Kit and paperwork consolidation – 1 package, 1 form to complete
- Lower, compliance level reporting limits
- Additional minerals included
- Low-level bromide and bromate testing included (by method 300.1)

Compliance:

As a compliance test package, the BevCheck provides the same low detection levels as our full commercial test groupings.

Pricing:

This is one cost effective package to meet many needs.

List Price	\$350.00
Discount Price (if performed quarterly along with annual testing)	\$295.00
